SMALLPOX - Washington, D. C.

CHANGE OF DIAGNOSIS

Final virological and histological examination of specimens by the Laboratory Branch at the Communicable Disease Center from the case previously reported as smallpox (MMWR, Vol. 14, Nos. 20, 21, and 23) in Washington, D. C. has failed to confirm earlier findings that led to the statement that variola virus had been isolated. When the original vesicular fluid was inoculated onto the chorioallantoic membranes of eggs, distinct "pocks" were observed. Continued testing, however, showed that these pocks were non-specific, occurring irregularly on the

CHANGE OF DIAGNOSIS

(Continued from front page)

identified as varicella (chickenpox) virus. Antibody titrations of the patient's acute and convalescent sera showed an antibody rise from 1:8 to 1:256 against varicella virus and no antibody rise against vaccinia virus.

The previously reported diagnosis of smallpox in

Washington, D.C., has therefore been amended and the case recorded as chickenpox.

The World Health Organization and the Government of Ghana, from which Country the case had come, are being notified accordingly.

EPIDEMIOLOGIC NOTES AND REPORTS

MUMPS IN ST. GEORGE - Pribilof Islands, Alaska

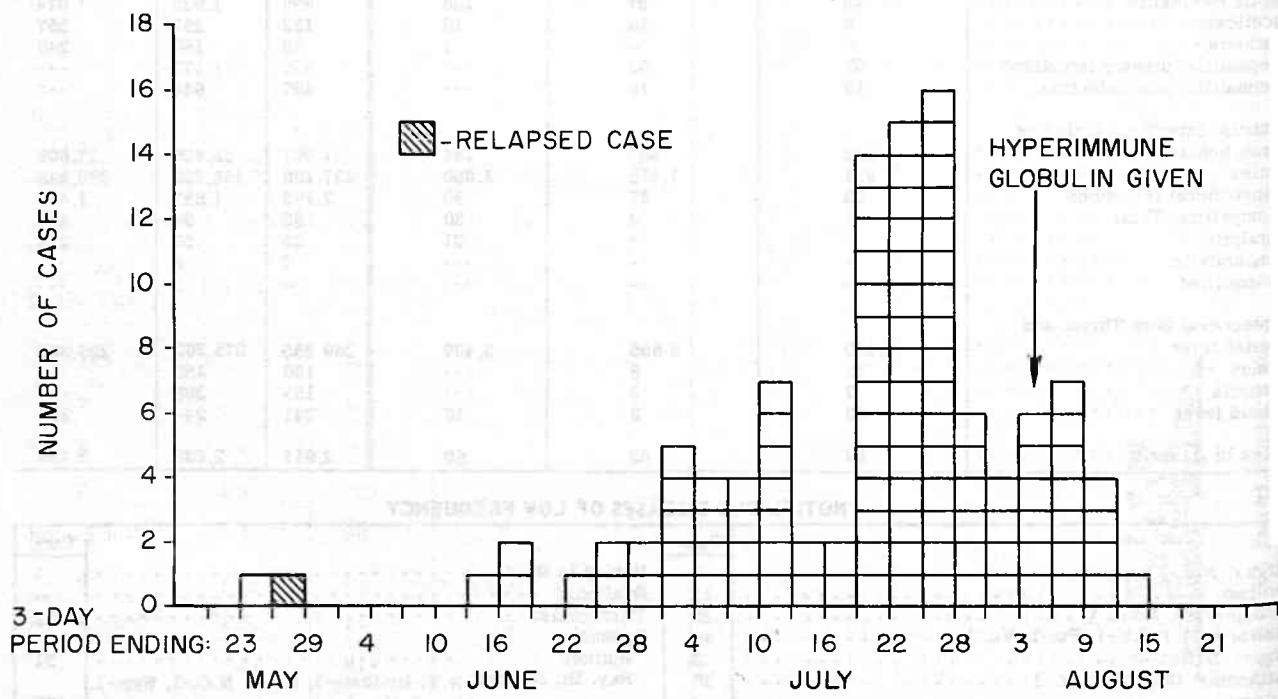

There has been a total of 107 cases of mumps among the 210 native inhabitants of St. George, Alaska, since May of this year. St. George is one of the Pribilof Islands located in the Bering Sea, approximately 250 miles from the mainland of Alaska and accessible only by ship. The last time mumps occurred on the Island was in 1907.

The first case was in a 15-year-old girl who left school in Oregon on May 12 and developed parotid swelling on May 26, 5 days after arrival at St. George. Another possible source of the epidemic was a 17-year-old girl who had a right-sided parotid swelling from May 3-8 while at school on the mainland of Alaska. On May 27, following her return to St. George, she developed a swelling of the left parotid. The next case was reported on June 15, followed by 6 others that month, 76 cases in July, and 22

cases during the first 13 days of August. Only one of the three cases occurring within the 4 weeks after the two schoolgirls became ill had any direct contact with them, although they may have attended church or a movie at the same time. (Figure 1)

The oldest patient was 56 years old; there were no cases among the 14 residents who were living at the time of the 1907 outbreak, only 3 of whom recalled having had mumps. Seventeen younger persons had had mumps while living off the island, mostly while at school or in the military service. Among those presumed susceptible, attack rates have been highest in the 10-14 age group (93%) and lowest in the 0-4 age group (37%). In other age groups less than 55 years of age, attack rates are between 50% and 69%. (Table 1 on page 284.)

CASES BY 3-DAY PERIOD, 1965*(Continued on back page)*

SURVEILLANCE SUMMARY

SALMONELLA - June 1965

During June a total of 2,174 isolations of salmonellae from human sources was reported to the Salmonella Surveillance Unit for an average weekly total of 435. This represented an increase of 14 isolations per week over May 1965, and a decrease of 4 isolations per week from June 1964. This conforms to the seasonal pattern of sal-

monellosis noted in this country during 1963 and 1964. (Figure 2).

The seven most commonly reported serotypes from human sources during June are listed in Table 2. (Reported by the Salmonella Surveillance Unit, Investigations Section, CDC.)

MUMPS IN ST. GEORGE – Pribilof Islands, Alaska
(Continued from page 278)

There have been 12 cases of orchitis among the 48 males with mumps. Of the 18 boys less than 10 years of age afflicted with mumps, two had orchitis, aged 2 years and 3 years respectively. Other complications have included meningoencephalitis and thyroiditis, and several patients had symptoms compatible with pancreatitis and oophoritis. The true incidence of these complications could not be determined.

Hyperimmune globulin was given to susceptible adults on August 4, but it is not yet possible to determine if this has reduced the incidence of the disease or its complications. At present no cases have occurred on the neighboring island of St. Paul.

Table 1.
MUMPS ATTACK RATES—SUSCEPTIBLE POPULATION
 St. George Island, Alaska
 May 24 – August 15, 1965

Age Group	Total	Population Susceptible	Number Cases	Attack Rate (%)
0 – 4	36	35	13	37.1
5 – 9	36	35	24	68.6
10 – 14	31	29	27	93.1
15 – 19	25	17	9	52.9
20 – 29	15	11	6	54.5
30 – 39	26	26	16	61.5
40 – 49	13	12	6	50.0
50 – 59	18	18	6	33.3
60 +	10	7	0	0.0
Total	210	190	107	56.3

(Reported by Dr. Holman Wherritt, Alaska Native Health Area Director, Anchorage, Alaska; Dr. Dwayne Reed, Acting Chief, Epidemiology Section, Arctic Health Research Center, Anchorage, Alaska; and a Field Epidemiologist from the Childhood Virus Disease Unit, CDC.)

THE MORBIDITY AND MORTALITY WEEKLY REPORT, WITH A CIRCULATION OF 14,000, IS PUBLISHED AT THE COMMUNICABLE DISEASE CENTER, ATLANTA, GEORGIA.

CHIEF, COMMUNICABLE DISEASE CENTER JAMES L. GODDARD, M.D.
 CHIEF, EPIDEMIOLOGY BRANCH A. D. LANGMUIR, M.D.
 ACTING CHIEF, STATISTICS SECTION IDA L. SHERMAN, M.S.
 CHIEF, SURVEILLANCE SECTION D. A. HENDERSON, M.D.
 EDITOR: MMWR D.J.M. MACKENZIE, M.B., F.R.C.P.E.

IN ADDITION TO THE ESTABLISHED PROCEDURES FOR REPORTING MORBIDITY AND MORTALITY, THE COMMUNICABLE DISEASE CENTER WELCOMES ACCOUNTS OF INTERESTING OUTBREAKS OR CASE INVESTIGATIONS WHICH ARE OF CURRENT INTEREST TO HEALTH OFFICIALS AND WHICH ARE DIRECTLY RELATED TO THE CONTROL OF COMMUNICABLE DISEASES. SUCH COMMUNICATIONS SHOULD BE ADDRESSED TO:

THE EDITOR
 MORBIDITY AND MORTALITY WEEKLY REPORT
 COMMUNICABLE DISEASE CENTER
 ATLANTA, GEORGIA 30333

NOTE: THE DATA IN THIS REPORT ARE PROVISIONAL AND ARE BASED ON WEEKLY TELEGRAMS TO THE CDC BY THE INDIVIDUAL STATE HEALTH DEPARTMENTS. THE REPORTING WEEK CONCLUDES ON SATURDAY; COMPILED DATA ON A NATIONAL BASIS ARE RELEASED ON THE SUCCEEDING FRIDAY.
